

Connectify – Logout and Delete Account Modal Implementation Report

1. Introduction

As part of the Connectify project, I implemented confirmation modals for logout and account deletion. These modals were designed to prevent users from accidentally logging out or permanently deleting their account. The implementation was completed across both the Navbar and Settings page to provide a consistent and accessible user experience.

2. Navbar Log Out Modal

The Navbar includes a logout option for authenticated users. On desktop, the logout option is available inside the profile dropdown alongside View Profile and Settings. On mobile, the logout option is available directly in the mobile navigation menu.

Instead of logging the user out immediately, clicking Log out triggers a confirmation modal. The modal asks the user to confirm the action and provides Cancel and Log out buttons. The logout button is styled in red to clearly communicate that it performs an important account action.

The Navbar also uses React state to control the modal and menu visibility. The profile dropdown and mobile menu can be closed by clicking outside them. When the user confirms the logout, the authentication logout function is called and the user is redirected to the landing page.

3. Settings Log Out Modal

A separate logout confirmation modal was implemented on the Settings page. The user can access it through the Log out button at the bottom of the page. The button is styled with a red icon and red text to make the logout action easy to identify.

When the user clicks the button, the confirmation modal appears instead of logging out immediately. The user can either cancel the action or confirm the logout. After confirmation, the existing authentication logout function is executed and the user is redirected to the signup page after a short delay. A logout confirmation message is also displayed.

4. Delete Account Modal

The Settings page also contains a Delete Account feature inside the Danger Zone section. Because account deletion is a permanent action, a confirmation modal was added before the deletion process takes place.

The modal clearly informs the user that deleting the account cannot be undone. The user can select Cancel to keep the account or Delete account to confirm the action. After confirmation, the saved notification preferences for new matches and new messages are removed from localStorage, a deletion success message is displayed, and the user is redirected to the signup page after a short delay.

5. Technologies and Methods Used

- **React and TypeScript:** Used to build and control the modal components and application behavior.
- **Tailwind CSS:** Used for modal layout, spacing, colors, borders, shadows, buttons, and responsive styling.
- **useState:** Used to control whether the logout and delete account modals are open or closed.
- **useEffect and useRef:** Used in the Navbar to detect clicks outside the profile dropdown and mobile menu.
- **React Router:** Used to navigate users after logout or account deletion.
- **Authentication Context:** Used to perform the actual logout operation.
- **localStorage:** Used to store notification preferences and remove them during account deletion.

6. Overall Outcome

The implementation provides a safer and more user-friendly account management experience. Users are given an opportunity to confirm important actions before they are completed, reducing accidental logout or account deletion. The modals are also consistent with the Connectify interface and work across both desktop and mobile navigation.

Conclusion

Overall, I implemented three related confirmation features: the Navbar Log Out Modal, the Settings Log Out Modal, and the Delete Account Modal. Together, these features improve account security, user control, and usability within the Connectify application.
